Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The sequence was derived from RNA isolated from hydridoma cells from mouse spleen cells. The protein can be used for binding heavy metals, such as lead cations. It can be used for detecting, removing, adding or neutralising the heavy metals in biological and inanimate systems. It can be used in e.g. aqueous liquid systems, in biological or environmental systems or in such compositions as perfumes, cosmetics, pharmaceuticals, health care products, skin treatment products, pesticides, herbicides, solvents used in the production of semiconductor and integrated circuit components and production materials

The sequence was derived from RNA isolated from hydridoma cells from mouse spleen cells. The protein can be used for bhoding heavy metals, such as lead cations. It can be used for bloding heavy metals or neutralising the heavy metals in biological and inanimate systems. It can be used in e.g. aqueous liquid systems, in biological or environmental systems or in such compositions as perfumes, cosmetics, pharmaceuticals, health care products, skin treatment products, pesticides, herbicides, solvents used in the production of semiconductor and integrated circuit components and production materials for electronic components.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   especially in gene therapy. The invention overcomes the restricted host range limitation of retroviral vectors. The present sequence is a gene encoding anti-Her2neu single chain antibody (scA). This sequence was used in the construction of plasmid pAJ7 which contains a tagetting vector comprising the anti-Her2neu scA fused to the SNV-Env(envelope)-TM(transmembrane) coding region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The patent discloses a novel retroviral vector, particularly Spleen Necrosis Virus (SNV) vector, having target cell specificity. The vector has a targetting envelope which is a chimeric protein consisting of an antigen binding site of an antibody (e.g. anti-DNP-scFv) or another peptide that binds to a specific cell surface protein, fused to the carboxy terminal part of the retroviral envelope protein. The presence of the wild type envelope protein serves as a helper molecule to improve or supplement a functional membrane fusion domain. The antigen binding site replaces the natural viral receptor binding site. The retroviral vector is used for cell specific gene transfer,
                                                                                                                                                        Monoclonal antibody; MAb; lipoteichoic acid; gram positive; bacteria; immunoglobulin; phagocytosis; infection; epitope; peptide mimic; MAb 96-110; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cell specific gene transfer using retroviral vectors containing antibody-envelope fusion proteins and wild type envelope proteins

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a monoclonal antibody (MAb) to lipoteichoic acid of gram positive bacteria, where the MAb is a chimeric immunoglobulin comprising at least part of a human immunoglobulin constant region and at least part of a non-human immunoglobulin variable region having specificly to lipoteichoic acid of gram positive bacteria. The antibodies bind to whole bacteria and enhance phagocytosis and killing of the bacteria and enhance protection from lethal infection. The antibodies or peptides (encoded by a DNA of the variable region of anti-lipoteichoic acid antibody or characterised by amino acids (CDRs) of the variable region of the complementarity determining regions (CDRs) of the variable region of the antibody) can be used for treating the protection of the complementarity determining regions

They can also be used for the diagnosis of gram positive bacterial infections. Sequences AAX05579-83 represent gene fragments encoding the heavy chain variable regions of the anti-lipoteichoic antibody 96-100.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI; 1999-095329/08

The antibodies bind to whole bacteria and enhance protection from lethal infection. The antibodies or peptides (encoded by a DNA of the variable region of anti-lipoteichoic acid antibody or characterised by amino acids corresponding to one or more of the complementarity determining regions (CDRs) of the variable region of the antibody) can be used for treating or preventing infections caused by gram positive bacteria. They can also be used for the diagnosis of gram positive bacterial infections. Sequences AAX05579-83 represent gene fragments encoding the heavy chain variable regions of the anti-lipoteichoic antibody 96-100.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WPI;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                isolating the fused cells, culturing them and cloning positive hybrid cells; and screening the hybrid cells for prodn. of the required MAbs. The MAbs bind to the gut of a target insect but do not bind to mammalian BBMs. The DNA sequence can be operably linked to a toxin molety, esp. selected from e.g. Bacillus toxins, Pseudomonas exotoxin and phytolaccin, etc. The Abs are useful for control of insect pests, e.g. Coleoptera, Diptera, Hymenoptera and Lepidoptera. The pesticidal compsn. is pref.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                fragment. MAbs were produced by using insect guts, partic. insect brush border membranes (BBMs), esp. corn rootworm, as antigen; immunising a donor animal with the antigen; isolating immunocompetent B cells from the immunised animal; fusing B cells with a tumour cell line;

MAbs were produced by using insect guts, partic. Insect brush border membranes (BBMs), esp. corn rootworm, as antigen; immunocompetent B immunising a donor animal with the antigen; isolating immunocompetent B cells from the immunised animal; fusing B cells with a tumour cell line; isolating the fused cells, culturing them and cloning positive hybrid cells; and screening the hybrid cells for prodn. of the required MAbs. The MAbs bind to the gut of a target insect but do not bind to mammallan BBMs. The DNA sequence can be operably linked to a toxin molety, esp. selected from e.g. Bacillus toxins, Pseudomonas exotoxin and phytolaccin, etc. The Abs are useful for control of insect pests, e.g. Coleoptera, Diptera, Hymenoptera and Lepidoptera. The pesticidal compsn. is pref.

cc anticorvulsant; and antidepressant. The sESTs can be used for gene cc therapy and in vaccines. The sESTs are useful as probes for the cidentification and isolation of full-length cDNAs and genomic DNA cc molecules which correspond to the sESTs. Proteins encoded by the sESTs care useful in assays for determining biological activity and raising cantibodies. They may be useful for treatment of autoimmune disorders cc (multiple sclerosis, insulin dependent diabetes), allergic conditions (casthma), myeloid or lymphoid cell deficiencies, wounds, burns, ulcers, costeoporosis, osteoarthritis, central nervous system disorders (C (Alzheimer's, Parkinson's, Huntington's disease, stroke), coagulation cdisorders (haemophilia, thrombosis), inflammatory disorders (Crohn's cdisease), tumours, bacterial, fungal or viral infections, depression and psoriasis. AAA45926 to AAA45931 represent linker variants which are given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Jacobs K,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ₽
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a monoclonal antibody (MAb) to lipoteichoic caid of gram positive bacteria, where the MAb is a chimeric immunoglobulin comprising at least part of a human immunoglobulin variable constant region and at least part of a non-human immunoglobulin variable region having specificity to lipoteichoic acid of gram positive bacteria. The antibodies bid to whole bacteria and enhance phagocycosis and killing of the bacteria and enhance protection from lethal infection. The antibodies or peptides (encoded by a DNA of the variable region of anti-lipoteichoic acid antibody or characterised by amino acids corresponding to one or more of the complementarity determining regions (CDRs) of the variable region of the antibody) can be used for treating cor preventing infections caused by gram positive bacteria. They can also be used for the diagnosis of gram positive bacteria infections. Sequences AAX05579-83 represent gene fragments encoding the heavy chain variable regions of the anti-lipoteichoic antibody 96-100.

inflammatory disorder, autoimmune disorders such as rheumatoid arthritis and multiple sclerosis, atherogenesis and atherosclerosis, and for inhibiting restenosis. They are useful in therapy or diagnosis, and in the manufacture of a medicament for treating CCR-2 mediated disease. They are also useful for treating allergy, anaphylaxis, malignancy, chronic and acute inflammation, histamine and IgE-mediated altergic reaction, shock, stenosis, allograft rejection, fibrotic disease, asthma, inflammatory glomerulopathies, acquired immune deficiency syndrome (AIDS), restenosis associated with vascular intervention, including angioplasty and/or stent placement in a mammal lumanised antibodies are also useful for inhibiting narrowing of the
                                                                                                                                                                                                                                                                                                                                                                                                                                 (CCK2), comprising an antigen binding region. The and at least a portion of an immunoglobulin of human origin. The humanised antibodies are useful for inhibiting the interaction of a cell expressing CCR2. They are useful for inhibiting or treating a cell expressing CCR2. They are useful for inhibiting or treating HIV infection. The proteins of the invention are useful for inhibiting the infection of the invention are useful for inhibiting the interaction of an immunoglobulin of human origin. The interaction of an immunoglobulin of human origin. The interaction of a cell expression of inhibiting the interaction of a cell expression are useful for inhibiting or treating a cell expression are useful for inhibiting the interaction of a cell expression of the invention are useful for inhibiting the interaction of a cell expression are useful for inhibiting or treating the invention are useful for inhibiting the invent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The patent discloses a humanised antibody or its antigen-binding fragment, having binding specificity for CC-Chemokine receptor 2 (CCR2), comprising an antigen binding region of non-human origin and at least a portion of an immunoglobulin of human origin.                                                                                                                                                                                                                                                                     The invention relates to a monoclonal antibody (MAb) to lipoteichoic cald of gram positive bacteria, where the MAb is a chimeric immunoglobulin comprising at least part of a human immunoglobulin variable constant region and at least part of a non-human immunoglobulin variable region having specificity to lipoteichoic acid of gram positive bacteria. The antibodies bind to whole bacteria and enhance phagocytosis and cantibodies or peptides (encoded by a DNA of the variable region of antibodies or peptides (encoded by a DNA of the variable region of cantilpoteichoic acid antibody or characterised by amino acids corresponding to one or more of the complementarity determining regions (CDRs) of the variable region of the antibody) can be used for treating cor preventing infections caused by gram positive bacteria. They can also be used for the diagnosis of gram positive bacterial infections. Sequences AXX05579-83 represent gene fragments encoding the heavy chain cariable regions of the anti-lipoteichoic antibody 96-100.
                                                                                                                  Query match

                                                                                                                                                       The invention relates to a monoclonal antibody (MAb) to lipoteichoic acid of gram positive bacteria, where the MAb is a chimeric immunoglobulin comprising at least part of a human immunoglobulin constant region and at least part of a non-human immunoglobulin variable region having specificity to lipoteichoic acid of gram positive bacteria. The antibodies bind to whole bacteria and enhance phagocytosis and killing of the bacteria and enhance protection from lethal infection. The antibodies or peptides (encoded by a DNA of the variable region of anti-lipoteichoic acid antibody or characterised by amino acids corresponding to one or more of the complementarity determining regions (CDRs) of the variable region of the antibody) can be used for treating or preventing infections caused by gram positive bacteria. They can also be used for the diagnosis of gram positive bacterial infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAX05581 standard; DNA; 57
